

Why, When and How you should use the Phish Alert Button

The "Phish Alert" button (PAB) is a feature in Outlook for Windows that helps users to immediately report phishing emails to our Information Security Team.

By reporting phishing emails, proper steps can be taken to block senders as well as remove the malicious message from the inboxes of other affected employees. Once the email has been validated and proved to be safe, it will be returned to your inbox.

We encourage all faculty and staff to use the "Phish Alert" button to efficiently communicate phishing attempts!
