Abstract

In this paper, we investigated Bianchi Type I magnetized cosmological model with cosmological constant in Rosen’s bimetric theory of gravitation by using the techniques of Letelier and Stachel. The nature of the model is discussed in presence as well as in absence of the magnetic field and cosmological constant. Our model exists and it never goes to vacuum if cosmological constant is not equal to zero and for finite value of cosmic time. In the presence of magnetic field, our model goes to vacuum when the cosmic time tends to minus infinity. Further in the absence of magnetic field the model exists if cosmological constant is negative and \( n \) lies between zero and half and our model is filled with dark matter if cosmological constant is positive and \( n \) is greater than half. It is realized that, in the absence of cosmological constant our model goes over to the vacuum model.

Keywords: Gravitational theory, electromagnetic fields, cosmology

1. Introduction

In the early phase of the universe, there is no definite evidence that the present day universe (FRW universe) was of the same type. Therefore it is important to study different Bianchi Type models in the context of the early phase of the universe. Several theories of gravitation have been formulated which are considered to be alternatives to Einstein’s theory of gravitation. One of them is Rosen’s (1977) bimetric theory of gravitation. The Rosen’s bimetric theory is the theory of gravitation based on two metrics. One is the fundamental metric tensor $g_{ij}$ which describes the gravitational potential and the second metric $\gamma_{ij}$ refers to the flat space–time and describes the inertial forces associated with the acceleration of the frame of reference. The metric tensors $g_{ij}$ determine the Riemannian geometry of the curved space time which plays the same role as given in Einstein’s general relativity and it interacts with matter. The background metric $\gamma_{ij}$ refers to the geometry of the empty universe (no matter but gravitation is there) and describes the inertial forces. The metric tensor $\gamma_{ij}$ has no direct physical significance but appears in the field equations. Therefore, it interacts with $g_{ij}$ but not directly with matter. One can regard $\gamma_{ij}$ as giving the geometry that would exist if there were no matter. In the absence of matter one would have $g_{ij} = \gamma_{ij}$.

Thus, at every point of space–time, there are two metrics

$$ds^2 = g_{ij}dx^i dx^j,$$

$$d\eta^2 = \gamma_{ij}dx^i dx^j.$$

The field equation of Rosen’s (1974) bimetric theory of gravitation is given by

$$N'_i = \frac{1}{2}N\delta'_i + \Lambda'_i = -8\pi kT'_i,$$

where $N = N'_i$, $k = \frac{|G|}{\sqrt{\gamma}}$ together with $g = \det(g_{ij})$ and $\gamma = \det(\gamma_{ij})$. Here, the vertical bar (|) stands for $\gamma$–covariant differentiation and $T'_i$ is the energy–momentum tensor of matter fields.

Several aspects of bimetric theory of gravitation have been studied by Rosen (1974, 1977), Goldman (1976), Karade (1980), Katore et al. (2006), Isrelit (1981), Khadekar et al. (2007). In particular, Reddy et al. (1998) have obtained some Bianchi Type cosmological models in bimetric theory of gravitation. The purpose of Rosen’s bimetric theory is to get rid of the singularities that occur in general relativity that was appearing in the big–bang in cosmological models and therefore, recently, there has been a lot of interest in cosmological models in related to Rosen’s bimetric theory of gravitation.

In the context of general relativity cosmic strings do not occur in Bianchi Type models. In it some Bianchi Type cosmological models – two in four and one in higher dimensions– are
studied by Krori et al. (1994). They showed that the cosmic strings do not occur in Bianchi Type V cosmology. Bali and Dave (2003), Bali and Upadhaya (2003), Bali and Singh (2005) have investigated Bianchi Type IX, I and V string cosmological models under different physical conditions in general relativity. Raj Bali and Anjali (2006) have investigated Bianchi Type I magnetized string cosmological model in general relativity by introducing the condition \( A = (BC)^n \), where \( n > 0 \) in Einstein field equations, whereas Raj Bali and Umesh Kumar Pareek (2007) have deduced Bianchi Type I string dust cosmological model with magnetic field in general relativity by imposing the condition \( A = N (BC)^n \), where \( n > 0 \) and \( N \) is proportionality constant in Einstein field equations. Further Borkar et al. (2009, 2010), Gaikwad et al. (2011) and Kandalkar et al. (2011) have been investigated many magnetized cosmological models in bimetric theory of gravitation by using the techniques of Letelier and Stachel [(1979), (1983), (1980)].

In this paper, we investigated Bianchi Type I magnetized cosmological model with \( \Lambda \)-term in Rosen’s bimetric theory of gravitation by using the techniques of Letelier and Stachel [(1979, 1983), 1980] and using the condition \( A = (BC)^n \), where \( n > 0 \) in Rosen’s field equations. The physical and geometrical significance of the model are discussed in the presence as well as in the absence of the magnetic field and cosmological constant \( \Lambda \).

It is realized that, in the absence of cosmological constant \( \Lambda \) our model goes over to the model of Borkar et al. (2010) and there is no any new contribution than that of it.

2. Solutions of Rosen’s Field Equations

We consider Bianchi Type I metric in the form

\[
\text{ds}^2 = -d t^2 + A^2 dx^2 + B^2 dy^2 + C^2 dz^2, \tag{4}
\]

where \( A, B \) and \( C \) are functions of \( t \) alone. Here \( B \neq C \) otherwise we get LRS Bianchi Type I model.

The flat metric corresponding to metric (4) is

\[
\text{d}\eta^2 = -dt^2 + dx^2 + dy^2 + dz^2. \tag{5}
\]

The energy momentum tensor \( T_i^j \) for the string dust with magnetic field is taken as

\[
T_i^j = (\varepsilon + p) u_i u^j + p g_i^j - \lambda x_i x^j + E_i^j, \tag{6}
\]

with
\[ \nu^i \nu_i = -x_i \ x^i = -1, \quad (7) \]
\[ \nu^j x_j = 0. \quad (8) \]

In this model, \( \epsilon, \lambda, p, \nu^i \) and \( x_i \) denote the rest energy density, the string tension density, pressure, the flow vector and the direction of strings of the system respectively.

The electromagnetic field \( E_{ij} \) is given by Lichnerowicz (1967)

\[ E_{ij} = \frac{\mu}{n^2} \left[ \nu^i \nu_j + \frac{1}{2} g_{ij} \right], \quad (9) \]

where \( \mu \) is the magnetic permeability.

The four velocity vector \( \nu_i \) is given by

\[ g_{ij} \nu^i \nu^j = -1. \quad (10) \]

The magnetic flux vector \( h_i \) is defined by

\[ h_i = \frac{\sqrt{-g}}{2\mu} \epsilon_{ijkl} F^{kl} \nu^j, \quad (11) \]

where \( F_{kl} \) is the electromagnetic field tensor and \( \epsilon_{ijkl} \) is the Levi Civita tensor density.

Assume the comoving coordinates and hence we have

\[ \nu^1 = \nu^2 = \nu^3 = 0, \ \nu^4 = 1. \]

Further we assume that the incident magnetic field is taken along \( x \)-axis, so that

\[ h_1 \neq 0, \quad h_2 = h_3 = h_4 = 0. \]

The first set of Maxwell’s equation

\[ F_{[ij,k]} = 0, \quad (12) \]

yields

\[ F_{23} = \text{constant} = H \text{(say)}. \]
Due to the assumption of infinite electrical conductivity, we have

\[ F_{14} = F_{24} = F_{34} = 0. \]

The only non-vanishing component of \( F_{ij} \) is \( F_{23} \). Hence,

\[ h_1 = \frac{AH}{\mu BC} \]  

(13)

and

\[ |h|^2 = \frac{H^2}{\mu^2 B^2 C^2}. \]  

(14)

From equation (9), we obtain

\[-E_1^2 = E_2^2 = E_3^2 = -E_4^2 = \frac{H^2}{2\mu B^2 C^2}. \]  

(15)

Equation (6) of energy momentum tensor yields

\[ T_1^1 = \left( p - \lambda - \frac{H^2}{2\mu B^2 C^2} \right), T_2^2 = T_3^3 = \left( p + \frac{H^2}{2\mu B^2 C^2} \right), T_4^4 = \left( -\epsilon - \frac{H^2}{2\mu B^2 C^2} \right). \]  

(16)

The Rosen’s field equation (3) for the metric (4) and (5) together with (16) lead to the following system of equations:

\[-\frac{A_{44}}{A} + \frac{B_{44}}{B} + \frac{C_{44}}{C} + \frac{A_4^2}{A^2} - \frac{B_4^2}{B^2} - \frac{C_4^2}{C^2} = 16\pi ABC \left( -p + \lambda + \frac{H^2}{2\mu B^2 C^2} \right) - 2\Lambda, \]  

(17)

\[ \frac{A_{44}}{A} - \frac{B_{44}}{B} + \frac{C_{44}}{C} - \frac{A_4^2}{A^2} + \frac{B_4^2}{B^2} - \frac{C_4^2}{C^2} = 16\pi ABC \left( -p - \frac{H^2}{2\mu B^2 C^2} \right) - 2\Lambda, \]  

(18)

\[ \frac{A_{44}}{A} + \frac{B_{44}}{B} - \frac{C_{44}}{C} - \frac{A_4^2}{A^2} - \frac{B_4^2}{B^2} + \frac{C_4^2}{C^2} = 16\pi ABC \left( -p - \frac{H^2}{2\mu B^2 C^2} \right) - 2\Lambda, \]  

(19)

\[ \frac{A_{44}}{A} + \frac{B_{44}}{B} + \frac{C_{44}}{C} - \frac{A_4^2}{A^2} - \frac{B_4^2}{B^2} - \frac{C_4^2}{C^2} = 16\pi ABC \left( \epsilon + \frac{H^2}{2\mu B^2 C^2} \right) - 2\Lambda, \]  

(20)

where
\[ A_4 = \frac{dA}{dt}, \quad B_4 = \frac{dB}{dt}, \quad C_4 = \frac{dC}{dt}, \text{ etc.} \]

From equations (18) and (19), we obtain
\[
\frac{C_{44}}{C} = \frac{B_{44}}{B} = \frac{C_{44}^2}{C^2} - \frac{B_{44}^2}{B^2}. \tag{21}
\]

Equations (17) and (18) lead to
\[
2 \frac{B_{44}}{B} - 2 \frac{A_{44}}{A} + 2 \frac{A_{44}^2}{A^2} - 2 \frac{B_{44}^2}{B^2} = 16\pi ABC \left( \lambda + \frac{2K}{B^2C^2} \right), \tag{22}
\]

where
\[ K = \frac{H^2}{2\mu}. \]

Equations (20) and (22), after using string dust condition \( (\varepsilon = \lambda) [\text{Zeldovich (1980)}] \), lead to
\[
\frac{B_{44}}{B} - 3 \frac{A_{44}}{A} + \frac{C_{44}}{C} + 3 \frac{A_{44}^2}{A^2} - \frac{B_{44}^2}{B^2} + \frac{C_{44}^2}{C^2} = 16\pi A \left( \frac{K}{BC} \right) + 2\Lambda. \tag{23}
\]

The field equations (17)-(20) are the system of four equations in six unknown parameters \( A, B, C, \lambda, \varepsilon \) and \( p \). Therefore, to deduce a determinate solution, we assume two extra conditions. First is that the component \( \sigma_{ij}^1 \) of shear tensor \( \sigma_{ij}^j \) is proportional to the expansion \( (\theta) \), which leads to
\[ A = (BC)^n, \text{ where } n > 0 \tag{24} \]

and second is Zeldovich condition \( \varepsilon = \lambda \). Using the first condition (equation (24)), in the equation (23), we obtain
\[
(1 - 3n) \frac{B_{44}}{B} - (3n + 1) \frac{C_{44}}{C} + (3n - 1) \frac{B_{44}^2}{B^2} + (3n + 1) \frac{C_{44}^2}{C^2} = 16\pi K (BC)^{n-1} + 2\Lambda. \tag{25}
\]

Now, the equation (21), which can be rewritten as
\[
\frac{(CB_4 - BC_4) A_4}{(CB_4 - BC_4) B} = \frac{B_4}{B} + \frac{C_4}{C}, \tag{26}
\]
which after integrating reduces to

\[ C^2 \left( \frac{B}{C} \right)_4 = LBC, \tag{27} \]

where \( L \) is a constant of integration.

Assume \( BC = \mu, \frac{B}{C} = v \). Then, \( B^2 = \mu v, \ C^2 = \frac{\mu}{v} \). In view of these relations, equation (27) becomes

\[ \frac{v_4}{v} = L. \tag{28} \]

Now equation (25) after using (24) and using assumptions \( BC = \mu \) and \( \frac{B}{C} = v \) lead to

\[ -3n \frac{\mu_4}{\mu} + 3n \left( \frac{\mu_4^2}{\mu^2} \right) - \left( \frac{v_4}{v^2} \right) + \frac{v_4}{v} = 16\pi \mu^{(n-1)} K + 2\Lambda. \tag{29} \]

The equations (28) and (29) yield

\[ 2\mu_{44} - 2\frac{\mu_4^2}{\mu} = -\frac{4}{3n} \left[ 8\pi \mu^n K + \Lambda \mu \right], \tag{30} \]

which reduces to

\[ \frac{d}{d\mu} \left[ f^2 \right] - 2 \frac{f^2}{\mu} = -\frac{4}{3n} \left[ 8\pi \mu^n K + \Lambda \mu \right], \tag{31} \]

where \( \mu_4 = f(\mu) \). Integrating equation (31), we get

\[ f^2 = P\mu^2 - \frac{32\pi K\mu^{n+1}}{3n(n-1)} - \frac{4\Lambda}{3n} \mu^2 \log \mu, \tag{32} \]

where \( P \) is an integrating constant. From equation (28), we obtain

\[ \log v = \int \frac{L \, d\mu}{\sqrt{P\mu^2 - \frac{32\pi K\mu^{n+1}}{3n(n-1)} - \frac{4\Lambda}{3n} \mu^2 \log \mu}} + \log b, \tag{33} \]

where \( b \) is a constant of integration.
Now, using \( \mu_4 = f(\mu) \) and expression (32), the metric (4) will be
\[
ds^2 = -\frac{d\mu^2}{P\mu^2 - 32\pi K\mu^{n+1} + \frac{4\Lambda}{3n} \mu^2 \log \mu} + \mu^{2n} dx^2 + \mu v dy^2 + \frac{\mu}{v} dz^2, \tag{34}
\]
where \( v \) is determined by equation (33).

After suitable transformation of co–ordinates
\[
\mu = T, \quad x = X, \quad y = Y, \quad z = Z,
\]
i.e.,
\[
d\mu = dT, \quad dx = dX, \quad dy = dY, \quad dz = dZ,
\]
the model (34) reduces to
\[
ds^2 = -\frac{dT^2}{P T^2 - 32\pi K T^{n+1} + \frac{4\Lambda}{3n} T^2 \log T} + T^{2n} dX^2 + T v dy^2 + \frac{T}{v} dz^2. \tag{35}
\]

Now choosing the cosmic time \( u = \pm \log T \), for convenience, we select \( u = -\log T \), and then the model (35) is reduced to
\[
ds^2 = -\frac{du^2}{P - \frac{32\pi}{3n(n-1)} K (e^{-u})^{n-1} + \frac{4\Lambda}{3n} u} + e^{-u} [(e^{-u})^{2n-1} dX^2 + v dy^2 + \frac{1}{v} dz^2]. \tag{36}
\]

This is the Bianchi Type I magnetized cosmological model with \( \Lambda \) - term in bimetric theory of gravitation.

3. Physical Quantities of the Model

The energy density \( \varepsilon \), the string tension density \( \lambda \), the pressure \( p \) for the model (36) (in terms of cosmic time \( u \)) are given by
\[
\varepsilon (= \lambda) = \frac{(2n-1)\Lambda}{24n\pi} (e^u)^{n+1} - \frac{(4n+1)}{3n} Ke^{2u}, \quad 0 < n \neq \frac{1}{2}, \tag{37}
\]
\[
p = -\frac{\Lambda}{12\pi} (e^u)^{n+1} - \frac{2}{3} K e^{2u}, \quad (38)
\]

respectively. For \( \Lambda \neq 0 \) and finite \( u \), the condition \( \varepsilon > 0 \) and \( p > 0 \) satisfies if

\[
8\pi \frac{(4n+1)}{(2n-1)} K (e^{-u})^{n-1} < \Lambda < -8\pi K (e^{-u})^{n-1}, \quad (39)
\]

and \( \varepsilon = 0, \ p = 0 \) gives \( n = 0 \), which contradict the fact that \( n > 0 \). Thus, the model never goes to vacuum model, for finite value of \( u \) and for \( \Lambda \neq 0 \).

The strong energy conditions of Hawking and Ellis (1973): \( (\varepsilon - p) > 0 \) and \( (\varepsilon + p) > 0 \) are satisfied by our model (36) if

\[
8\pi \frac{(2n+1)}{(4n-1)} K (e^{-u})^{n-1} < \Lambda < -8\pi (6n+1) K (e^{-u})^{n-1}. \quad (40)
\]

The expansion \( \theta \) is given by \( \left( \frac{A_4}{A} + \frac{B_4}{B} + \frac{C_4}{C} \right) \) and for the model (36), it has the value

\[
\theta = (n+1) f e^u,
\]

which (after using (32)) reduces to

\[
\theta = (n+1) \left[ P - \frac{32\pi K (e^{-u})^{n-1}}{3n(n-1)} + \frac{4\Lambda u}{3n} \right]^{\frac{1}{2}}. \quad (41)
\]

The components of shear tensor \( (\sigma^j_i) \) are given by

\[
\sigma_1^1 = \frac{1}{3} \left[ \frac{2A_4}{A} - \frac{B_4}{B} - \frac{C_4}{C} \right],
\]

or

\[
\sigma_1^1 = \frac{(2n-1)}{3} \left[ P - \frac{32\pi K (e^{-u})^{n-1}}{3n(n-1)} + \frac{4\Lambda u}{3n} \right]^{\frac{1}{2}}, \quad (42)
\]

\[
\sigma_2^2 = -\frac{1}{2} \sigma_1^1 + \frac{L}{2}, \quad (43)
\]
\[ \sigma_3^3 = - \frac{1}{2} \sigma_1^1 - \frac{L}{2}, \quad (44) \]
\[ \sigma_4^4 = 0. \quad (45) \]

**Special Case**

In the absence of magnetic field, i.e., for \( K = 0 \), the expressions for the energy density \( \epsilon \), the string tension density \( \lambda \), the pressure \( p \), scalar of expansion \( \theta \) and components of shear tensor \( \sigma^i_j \) are given by

\[ \epsilon \left( = \lambda \right) = \frac{(2n-1)\Lambda}{24n\pi} (e^u)^{n+1}, \quad (46) \]
\[ p = \frac{-\Lambda}{12\pi} (e^u)^{n+1}, \quad (47) \]
\[ \theta \left( = \lambda \right) = (n+1) \left[ P + \frac{4\Lambda}{3n} \frac{u}{3n} \right]^{\frac{1}{2}}, \quad (48) \]
\[ \sigma_1^1 = \frac{(2n-1)}{3} \left[ P + \frac{4\Lambda}{3n} \frac{u}{3n} \right]^{\frac{1}{2}}, \quad (49) \]
\[ \sigma_2^2 = \frac{(2n-1)}{6} \left[ P + \frac{4\Lambda}{3n} \frac{u}{3n} \right]^{\frac{1}{2}} + \frac{L}{2}, \quad (50) \]
\[ \sigma_3^3 = \frac{(2n-1)}{6} \left[ P + \frac{4\Lambda}{3n} \frac{u}{3n} \right]^{\frac{1}{2}} - \frac{L}{2}, \quad (51) \]
\[ \sigma_4^4 = 0. \quad (52) \]

**4. Conclusion**

There is no big-bang and big crunch singularities in our model (36). It is interesting to note that the cosmological constant \( \Lambda \) is playing an important role in our model. From the equations (37), (38) and (39), it is seen that the rest energy density \( \epsilon \), string tension density \( \lambda \) and pressure \( p \) all are positive if \( \Lambda \) lies in the open interval in equation (39), for \( n \) is not equal to half and for finite \( u \). This shows that such a Bianchi Type I magnetized cosmological model (36) in bimetric theory of gravitation exists when cosmological constant \( \Lambda \) lies in the open interval in the equation (39). It never goes to vacuum model for \( \Lambda \) is not equal to zero and for finite value of \( u \). When \( u \rightarrow -\infty \), then \( \theta \rightarrow -\infty \), \( \sigma \rightarrow -\infty \) and when \( u \rightarrow \infty \), then \( \theta \rightarrow \infty \), \( \sigma \rightarrow \infty \). This
confirms that the model is expanding as well as shearing. The scalar of expansion and the shear in the model increases as cosmic time $u$ increases.

Further when $u \to \infty$, then $\varepsilon = \lambda \to \infty$, $p \to \infty$. When $u \to -\infty$, then $\varepsilon = \lambda \to 0$ and $p \to 0$, which shows that our model goes over to vacuum model, when the cosmic time $u$ is minus infinity. In the special case, in the absence of magnetic field, i.e., $K = 0$, from the equation (46) and (47), it is seen that our model (36) exists if $\Lambda$ is negative and $n$ between zero and half and if the cosmological constant $\Lambda > 0$ then our model filled with dark matter for $n$ greater than half, for finite value of cosmic time $u$. Also the expansion and shear in the model increases, as the cosmic time $u$ increases. Further it is observed that in the absence of cosmological constant $\Lambda$ i.e. if $\Lambda = 0$ then our model (36) goes over to the model of Borkar et al. (2010) and there is no any new contribution than that of it.
